

SPX II

The print module for highest demands.

SPX II -

Printing at high speed.

With the SPX II print module labels, textiles and plastic materials can be printed on with a high resolution both in the dispensing mode and continuous mode. Due to its detachable and mobile control unit, the print module can be easily integrated into almost any packaging system. In addition to the current printheads for thermal transfer printing, durable printheads are offered in particular for thermal direct printing.

The print module designed for high-speed applications with a high throughput of labels are particularly suited for printing and application systems such as mail sorting systems, pallet labelling and labelling of electronic components. In the development process of the SPX II series, great attention was paid to ensure that both housing and printing mechanics are made of high-quality materials and thus guarantee a high level of reliability, even under harsh operating conditions.

Right and left version

The SPX II high-performance print modules are pure printing systems to be integrated into existing labelling systems. The module prints and dispenses in every installation direction and was developed particularly for labelling round-the-clock. All models of the SPX II print module are available in both versions: right and left.

Powerful ports

The print modules of SPX II series are equipped with four efficient internal standard interfaces. In addition to a serial, parallel and USB interface an internal LAN interfaces for network connection is available. For wireless data transmission the printer can be equipped with a WLAN interface optionally. Moreover a USB host for connection of a USB keyboard or a memory stick is integrated at the control unit.

Stainless steel housing

To provide individual industry solutions for food, beverage, chemical and pharmaceutical industries and medical engineering etc., the housing of all SPX II devices can, on request, be made of stainless steel which meets the highest of hygiene standards.

Pneumatic spring

In the housing cover, a damping mechanism has been integrated to avoid unintentional closing and/or opening of the cover. When folded open, the cover is cushioned for a soft end stop. Adjacent components are protected from damage.
